Description globale : ****Outil financier permettant de suivre la valeur accumulée dans un but particulier. Dans le domaine de la santé, utilisé pour suivre les frais d'un patient, les centres de coûts, etc.**

version : 0.0.1

Liste des propriétés

[*] S'il n'y a pas de type dans un attribut, c'est parce qu'il peut avoir plusieurs types ou différents formats/modèles.

- `_description[object]`: Extensions de la description

- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de l'élément. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.

- `_implicitRules[object]`: Extensions pour implicitRules

- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de l'élément. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.

- `_language[object]`: Extensions linguistiques

- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de l'élément. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.

- `_name[object]`: Extensions du nom

- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de l'élément. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.

- `_status[object]`: Extensions du statut

- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de l'élément. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.

- `address[object]`: L'adresse postale . Model: <https://schema.org/address>

- `addressCountry[string]`: Le pays. Par exemple, l'Espagne . Model: <https://schema.org/addressCountry>

- `addressLocality[string]`: La localité dans laquelle se trouve l'adresse postale et qui se trouve dans la région . Model: <https://schema.org/addressLocality>

- `addressRegion[string]`: La région dans laquelle se trouve la localité et qui se trouve dans le pays . Model: <https://schema.org/addressRegion>

- `district[string]`: Un district est un type de division administrative qui, dans certains pays, est géré par le gouvernement local.

- `postOfficeBoxNumber[string]`: Le numéro de la boîte postale pour les adresses de boîtes postales. Par exemple, 03578 . Model: <https://schema.org/postOfficeBoxNumber>

- `postalCode[string]`: Le code postal. Par exemple, 24004 . Model: <https://schema.org/postalCode>

- `streetAddress[string]`: L'adresse de la rue . Model: <https://schema.org/streetAddress>

- `alternateName[string]`: Un nom alternatif pour ce poste

- `areaServed[string]`: La zone géographique où un service ou un article est offert . Model: <https://schema.org/Text>

- `contained[array]`: Ces ressources n'ont pas d'existence indépendante de la ressource qui les contient - elles ne peuvent pas être identifiées indépendamment, et ne peuvent pas non plus avoir leur propre champ de transaction indépendant

- `coverage[array]`: La (les) partie(s) responsable(s) du paiement de ce compte, et l'ordre dans lequel elle(s) doit (doivent) être appliquée(s) au compte.

- `dataProvider[string]`: Une séquence de caractères identifiant le fournisseur de l'entité de données harmonisées

- `dateCreated[date-time]`: Horodatage de la création de l'entité. Celle-ci est généralement attribuée par la plate-forme de stockage

- `dateModified[date-time]`: Date de la dernière modification de l'entité. Cette date est généralement attribuée par la plate-forme de stockage

- `description[string]`: Fournit des informations supplémentaires sur ce que le compte suit et comment il est utilisé.

- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de la ressource. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout implémenteur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.

- `guarantor[array]`: Les parties responsables de l'équilibre du compte si les autres options de paiement ne suffisent pas

- `hl7type[object]`: catégorise le compte à des fins de rapport et de recherche

- `_text[object]`: Extensions pour le texte

- `coding[array]`: Une référence à un code défini par un système terminologique

- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de l'élément. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.

- `id[string]`: Identifiant unique de l'élément au sein d'une ressource (pour les références internes). Il peut s'agir de n'importe quelle chaîne de caractères ne contenant pas d'espaces.

- `id[*]`: Identifiant unique de l'entité
- `identifier[array]`: Identifiant unique utilisé pour référencer le compte. Il peut ou non être destiné à un usage humain (par exemple, un numéro de carte de crédit).
- `implicitRules[string]`: Référence à un ensemble de règles qui ont été suivies lors de la construction de la ressource et qui doivent être comprises lors du traitement du contenu. Il s'agit souvent d'une référence à un guide de mise en œuvre qui définit les règles spéciales avec d'autres profils, etc.
- `language[string]`: La langue de base dans laquelle la ressource est écrite
- `location[*]`: Référence Geojson à l'élément. Il peut s'agir d'un point, d'une chaîne de ligne, d'un polygone, d'un point multiple, d'une chaîne de ligne multiple ou d'un polygone multiple.
- `meta[object]`: Les métadonnées relatives à la ressource. Il s'agit d'un contenu géré par l'infrastructure. Les modifications apportées au contenu ne sont pas toujours associées aux changements de version de la ressource.
 - `_lastUpdated[object]`: Extensions pour lastUpdated
 - `_source[object]`: Extensions pour la source
 - `_versionId[object]`: Extensions pour versionId
- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de l'élément. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.
- `id[string]`: Identifiant unique de l'élément au sein d'une ressource (pour les références internes). Il peut s'agir de n'importe quelle chaîne de caractères ne contenant pas d'espaces.
- `lastUpdated[string]`: Date de la dernière modification de la ressource - par exemple, lorsque la version a été modifiée
- `profile[array]`: Une liste de profils (références aux ressources [[[StructureDefinition]]) auxquels cette ressource prétend se conformer. L'URL est une référence à [[[StructureDefinition.url]]]
- `security[array]`: Étiquettes de sécurité appliquées à cette ressource. Ces étiquettes relient des ressources spécifiques à la politique et à l'infrastructure de sécurité globale
- `source[string]`: Un uri qui identifie le système source de la ressource. Cela fournit une quantité minimale d'informations [[[Provenance]]] qui peuvent être utilisées pour suivre ou différencier la source d'information dans la ressource. La source peut identifier un autre serveur FHIR, un document, un message, une base de données, etc.
- `tag[array]`: Tags appliqués à cette ressource. Les étiquettes sont destinées à être utilisées pour identifier et relier les ressources au processus et au flux de travail, et les applications ne sont pas tenues de prendre en compte les étiquettes lorsqu'elles interprètent la signification d'une ressource.
- `modifierExtension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de la ressource et qui modifient la compréhension de l'élément qui le contient et/ou la compréhension des descendants de l'élément qui le contient. En général, les éléments modificateurs fournissent une négation ou une qualification. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur soit autorisé à définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension. Les applications qui traitent une ressource doivent vérifier la présence d'extensions de modificateurs.

Les extensions de modificateurs NE DOIVENT PAS modifier la signification d'un élément quelconque de Ressource ou DomainResource (y compris la signification de modifierExtension elle-même).

- `name[string]`: Nom utilisé pour le compte lorsqu'il est affiché aux humains dans les rapports, etc.
- `owner[object]`: Indique le service, l'hôpital, le département, etc. responsable de la gestion du compte.
 - `_display[object]`: Extensions pour l'affichage
 - `_reference[object]`: Extensions pour référence
 - `_type[object]`: Extensions pour le type
- `display[string]`: Texte en clair qui identifie la ressource en plus de la référence de la ressource
- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de l'élément. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.

- `id[string]`: Identifiant unique de l'élément au sein d'une ressource (pour les références internes). Il peut s'agir de n'importe quelle chaîne de caractères ne contenant pas d'espaces.

- `identifier[object]`: Un identifiant pour la ressource cible. Il est utilisé lorsqu'il n'existe aucun moyen de référencer directement l'autre ressource, soit parce que l'entité qu'il représente n'est pas disponible via un serveur FHIR, soit parce que l'auteur de la ressource n'a aucun moyen de convertir un identifiant connu en un emplacement réel. Il n'est pas nécessaire qu'un `Reference.identifier` pointe vers quelque chose qui est réellement exposé en tant qu'instance FHIR, mais il DOIT pointer vers un concept commercial qui devrait être exposé en tant qu'instance FHIR, et cette instance devrait être d'un type de ressource FHIR autorisé par la référence.

- `reference[string]`: Une référence à un emplacement où l'autre ressource est trouvée. La référence peut être une référence relative, auquel cas elle est relative à l'URL de base du service, ou une URL absolue qui se résout à l'emplacement où la ressource est trouvée. La référence peut être spécifique à une version ou non. Si la référence n'est pas un serveur FHIR RESTful, il faut supposer qu'elle est spécifique à une version. Les références de fragments internes (commençant par "#") renvoient à des ressources contenues.

- `partOf[object]`: Référence à un compte parent

- `_display[object]`: Extensions pour l'affichage

- `_reference[object]`: Extensions pour référence

- `_type[object]`: Extensions pour le type

- `display[string]`: Texte en clair qui identifie la ressource en plus de la référence de la ressource

- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de l'élément. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.

- `id[string]`: Identifiant unique de l'élément au sein d'une ressource (pour les références internes). Il peut s'agir de n'importe quelle chaîne de caractères ne contenant pas d'espaces.

- `identifier[object]`: Un identifiant pour la ressource cible. Il est utilisé lorsqu'il n'existe aucun moyen de référencer directement l'autre ressource, soit parce que l'entité qu'il représente n'est pas disponible via un serveur FHIR, soit parce que l'auteur de la ressource n'a aucun moyen de convertir un identifiant connu en un emplacement réel. Il n'est pas nécessaire qu'un `Reference.identifier` pointe vers quelque chose qui est réellement exposé en tant qu'instance FHIR, mais il DOIT pointer vers un concept commercial qui devrait être exposé en tant qu'instance FHIR, et cette instance devrait être d'un type de ressource FHIR autorisé par la référence.

- `reference[string]`: Une référence à un emplacement où l'autre ressource est trouvée. La référence peut être une référence relative, auquel cas elle est relative à l'URL de base du service, ou une URL absolue qui se résout à l'emplacement où la ressource est trouvée. La référence peut être spécifique à une version ou non. Si la référence n'est pas un serveur FHIR RESTful, il faut supposer qu'elle est spécifique à une version. Les références de fragments internes (commençant par "#") renvoient à des ressources contenues.

- `resourceType[string]`: Il s'agit d'une ressource du Compte

- `seeAlso[*]`: liste d'uri pointant vers des ressources supplémentaires concernant l'élément

- `servicePeriod[object]`: La plage de dates des services associés à ce compte

- `_end[object]`: Extensions pour l'extrémité

- `_start[object]`: Extensions pour le démarrage

- `end[string]`: La fin de la période. Si la fin de la période est absente, cela signifie qu'aucune fin n'était connue ou planifiée au moment de la création de l'instance. Le début peut se situer dans le passé et la date de fin dans le futur, ce qui signifie que la période est censée/prévue pour se terminer à ce moment-là.

- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de l'élément. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.

- `id[string]`: Identifiant unique de l'élément au sein d'une ressource (pour les références internes). Il peut s'agir de n'importe quelle chaîne de caractères ne contenant pas d'espaces.

- `source[string]`: Séquence de caractères indiquant la source originale des données de l'entité sous forme d'URL. Il est recommandé d'utiliser le nom de domaine complet du fournisseur de la source ou l'URL de l'objet source.

- `status[string]`: Indique si le compte est actuellement utilisé/utilisable ou non.

- `subject[array]`: Identifie l'entité qui engage les dépenses. Bien que les bénéficiaires immédiats des services ou des biens puissent être des entités liées au sujet, les dépenses ont finalement été encourues par le sujet du compte.

- `text[object]`: Une description lisible par l'homme qui contient un résumé de la ressource et peut être utilisée pour représenter le contenu de la ressource à un être humain. La description ne doit pas nécessairement coder toutes les données structurées, mais doit contenir suffisamment de détails pour qu'un être humain puisse lire la description en toute sécurité sur le plan clinique. Les définitions des ressources peuvent définir le contenu qui doit être représenté dans le texte narratif pour garantir la sécurité clinique.

- `_status[object]`: Extensions du statut

- `div[*]`: Le contenu narratif proprement dit, une version simplifiée de XHTML

- `extension[array]`: Peut être utilisé pour représenter des informations supplémentaires qui ne font pas partie de la définition de base de l'élément. Pour que l'utilisation des extensions soit sûre et gérable, un ensemble strict de règles est appliqué à la définition et à l'utilisation des extensions. Bien que tout utilisateur puisse définir une extension, il existe un ensemble d'exigences qui DOIVENT être respectées dans le cadre de la définition de l'extension.

- `id[string]`: Identifiant unique de l'élément au sein d'une ressource (pour les références internes). Il peut s'agir de n'importe quelle chaîne de caractères ne contenant pas d'espaces.

Propriétés requises

- `id`

- `type`

Modèle de données mappé à partir de la version originale 4.3 de la norme HL7. L'attribut original `-type-` a été renommé en `-hl7type-` en raison du conflit avec le type obligatoire dans NGSI. En outre, d'autres adaptations mineures ont été effectuées. Voir <https://github.com/smart-data-models/dataModel.HI7/blob/master/README.md> à la racine du sujet

governance applied to the definition and use of extensions. Though any implementer
can define an extension, there is a set of requirements that SHALL be met as part
of the definition of the extension. Applications processing a resource are required
to check for modifier extensions.

        Modifier extensions SHALL NOT change the meaning of any
elements on Resource or DomainResource (including cannot change the meaning of
modifierExtension itself)

  description: Unique id for the element within a resource (for
internal references). This may be any string value that does not contain spaces
  type: string
identifier:
  description: 'An identifier for the target resource. This is
used when there is no way to reference the other resource directly, either because
the entity it represents is not available through a FHIR server, or because there
is no way for the author of the resource to convert a known identifier to an
actual location. There is no requirement that a Reference.identifier point to
something that is actually exposed as a FHIR instance, but it SHALL point to a
business concept that would be expected to be exposed as a FHIR instance, and that
instance would need to be of a FHIR resource type allowed by the reference'
  type: string
reference:
  description: "A reference to a location at which the other
resource is found. The reference may be a relative reference, in which case it is
relative to the service base URL, or an absolute URL that resolves to the location
where the resource is found. The reference may be version specific or not. If the
reference is not to a FHIR RESTful server, then it should be assumed to be version
specific. Internal fragment references (start with '#') refer to contained
resources"
  type: string
type:
  description: |-
    The expected type of the target of the reference. If both
    Reference.type and Reference.reference are populated and Reference.reference is a
    FHIR URL, both SHALL be consistent.
    The type is the Canonical URL of Resource Definition that is
    the type this reference refers to. References are URLs that are relative to http://
    hl7.org/fhir/StructureDefinition/ e.g. Patient is a reference to http://hl7.org/
    fhir/StructureDefinition/Patient. Absolute URLs are only allowed for logical models
    (and can only be used in references in logical models, not resources)

        type: string
      modifierExtension:
        description: |-
          May be used to represent additional information that is not
part of the basic definition of the element and that modifies the understanding of
the element in which it is contained and/or the understanding of the containing
element's descendants. Usually modifier elements provide negation or qualification.
To make the use of extensions safe and manageable, there is a strict set of
governance applied to the definition and use of extensions. Though any implementer
can define an extension, there is a set of requirements that SHALL be met as part
of the definition of the extension. Applications processing a resource are required
to check for modifier extensions.

          Modifier extensions SHALL NOT change the meaning of any
elements on Resource or DomainResource (including cannot change the meaning of
modifierExtension itself)

May be used to represent additional information that is not part of the basic definition of the resource and that modifies the understanding of the element that contains it and/or the understanding of the containing elements descendants. Usually modifier elements provide negation or qualification. To make the use of extensions safe and manageable, there is a strict set of governance applied to the definition and use of extensions. Though any implementer is allowed to define an extension, there is a set of requirements that SHALL be met as part of the definition of the extension. Applications processing a resource are required to check for modifier extensions.

Modifier extensions SHALL NOT change the meaning of any elements on Resource or DomainResource (including cannot change the meaning of modifierExtension itself)

```

```

extension, there is a set of requirements that SHALL be met as part of the
definition of the extension'
  items:
    type: string
  type: array
id:
  description: Unique id for the element within a resource (for
internal references). This may be any string value that does not contain spaces
  type: string
identifier:
  description: 'An identifier for the target resource. This is
used when there is no way to reference the other resource directly, either because
the entity it represents is not available through a FHIR server, or because there
is no way for the author of the resource to convert a known identifier to an
actual location. There is no requirement that a Reference.identifier point to
something that is actually exposed as a FHIR instance, but it SHALL point to a
business concept that would be expected to be exposed as a FHIR instance, and that
instance would need to be of a FHIR resource type allowed by the reference'
  type: string
reference:
  description: "A reference to a location at which the other
resource is found. The reference may be a relative reference, in which case it is
relative to the service base URL, or an absolute URL that resolves to the location
where the resource is found. The reference may be version specific or not. If the
reference is not to a FHIR RESTful server, then it should be assumed to be version
specific. Internal fragment references (start with '#') refer to contained
resources"
  type: string
type:
  description: |-
    The expected type of the target of the reference. If both
    Reference.type and Reference.reference are populated and Reference.reference is a
    FHIR URL, both SHALL be consistent.
    The type is the Canonical URL of Resource Definition that is
    the type this reference refers to. References are URLs that are relative to http://
    hl7.org/fhir/StructureDefinition/ e.g. Patient is a reference to http://hl7.org/
    fhir/StructureDefinition/Patient. Absolute URLs are only allowed for logical models
    (and can only be used in references in logical models, not resources)

            description: |-

```

May be used to represent additional information that is not part of the basic definition of the element and that modifies the understanding of the element in which it is contained and/or the understanding of the containing element's descendants. Usually modifier elements provide negation or qualification. To make the use of extensions safe and manageable, there is a strict set of governance applied to the definition and use of extensions. Though any implementer can define an extension, there is a set of requirements that SHALL be met as part of the definition of the extension. Applications processing a resource are required to check for modifier extensions.

Modifier extensions SHALL NOT change the meaning of any elements on Resource or DomainResource (including cannot change the meaning of modifierExtension itself)

Exemples de charges utiles

Compte Valeurs clés de l'INSV-v2 Exemple

Voici un exemple de compte au format JSON-LD en tant que valeurs clés. Ceci est compatible avec NGSI-v2 lorsque l'on utilise `options=keyValues` et renvoie les données contextuelles d'une entité individuelle.

show/hide example

```

{
